WEB-BASED IMAGING SERVICE PROVIDING THE ABILITY TO SPECIFY A CHARGE-BACK ACCOUNT

ABSTRACT OF THE DISCLOSURE

From a client browser, the user accesses a destination service representing a production device, e.g., printer, which downloads web content into the browser and retrieves the user's imaging data, e.g. from user's identity or from a hard disk. The destination service displays in the browser a menu including production options to process the user's imaging data and a list of charge-back account IDs. In some embodiments, the display includes only charge-back IDs that are customized to the user. The user selects production options and can specify a charge-back account ID. In some embodiments the charge-back account ID is required for certain options or for the entire production job to proceed. In some embodiments a cost breakdown is calculated and/or displayed for the job.
